Part 1. Why iOS Updates Sometimes Cause Major Problems?

It can be really exciting to install a new firmware version with the promise of newer functions and security improvements. Yet that excitement can quickly turn into something else when the process goes wrong during or after the update.

Most of the time, it even forces users to downgrade iOS for a solution. Let's take a closer look at the most common iOS update issues that leave users searching for help:

1. Stuck on "Verifying Update"

After downloading the update, some mobile phones get stuck on the "Verifying Update" screen. It usually happens when the system is not able to confirm the integrity of the firmware before installation. The device appears frozen and does not respond at all, despite how much you tap for the process continuity.

2. Endless Restart Loop

In some cases, your mobile may continuously restart without ever reaching the home screen. A common cause for that is corrupted iOS upgrade files or new software conflicts introduced during installation. The iOS device tries to boot but fails to complete the process, resulting in a never-ending cycle.

3. Frozen Apple Logo Screen

Another common issue occurs when the phone powers up but gets stuck on the company logo for no apparent reason. It can be triggered by factors ranging from interrupted updates and low storage space to unexpected power loss during the process. The phone refuses to move past this screen, making it inaccessible.

4. Black Screen After Update

Sometimes, the mobile display remains dark even though the phone is technically on. You might hear notifications or feel vibrations, but the display shows nothing at all to you. That can happen due to display driver errors or failed attempts to load the updated operating system properly.

5. Touchscreen Not Responding

A firmware upgrade may result in the mobile screen refusing to register taps or swipes for many users. This dilemma can stem from conflicts in settings or outdated apps that are unable to work with the new system. At times, bugs in the new iOS iteration itself can make even the basic navigation impossible.
